

Assessment Grill Master

Instructions

Your solution should be written in .NET / C#. It is also possible to write it in Java, JavaScript, or any other programming language. The interface is not important, you can create a simple console application.

For us at isolutions, quality is very important. We like our code to be testable, readable, clean, and easy to modify. In the evaluation we will look at the following points:

- Code quality
- Algorithm
- Sustainability and readability of the source code
- Documentation

Every tool (including AI) is allowed to be used for this assessment. In case you do not have enough time to implement something, just leave a comment about it. Please try to solve this task within one week. If you can't because of availability, let us know.

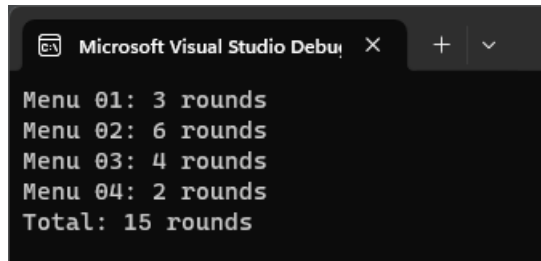

Scope

Help our barbecue chef, the grill master, to optimize the order in which barbecue items are grilled. Since the space on the grill is limited and grill items have varied sizes, you need to calculate optimal placement for grilling. The grill measures 20cm x 30cm. The cooking time is the same for all barbecue items.

A REST API provides you with different grill menus. A menu is a list of different pieces of meat with their required space. Your solution calculates the order in which the menu items are placed on the grill and minimizes the cooking duration, in rounds, of the entire menu.

REST API specification	http://isol-grillassessment.azurewebsites.net/swagger/docs/v1
Swagger UI	http://isol-grillassessment.azurewebsites.net/swagger/ui/index

The output should show the rounds for each grill menu and the sum of all grill rounds of all menus. For example:

```
Menu 01: 3 rounds
Menu 02: 6 rounds
Menu 03: 4 rounds
Menu 04: 2 rounds
Total: 15 rounds
```

Deliver the assessment

The code should be uploaded to a GitHub **PRIVATE** repository. Please do not set it as public. We will be able to access it with a token ([see how to create it at the end of this document](#)). These 3 values must be used for cloning the repo.

- Token
- GitHub user (repo owner)
- Repository name

Send us the following command with the variables filled with your values. Please test it locally before checking that the clone works as expected.

```
git -c credential.helper="" clone
https://isolgrillmaster:{{token}}@github.com/{{user}}/{{repoName}}.git
```

Happy Coding!

Token creation

OAuth Apps

Personal access tokens

Fine-grained tokens

Tokens (classic)

New fine-grained personal access token

Create a fine-grained, repository-scoped token suitable for personal API use and for using Git over HTTPS.

Token name *

isolutions-grillmaster-token

✔ 'isolutions-grillmaster-token' is available.
A unique name for this token. May be visible to resource owners or users with possession of the token.

Description

Resource owner

You

The token will only be able to make changes to resources owned by the selected resource owner. Tokens can always read all public repositories.

Expiration

30 days (Oct 04, 2026)

Set at least 30 days

The token will expire on the selected date

Repository access

☐ Public repositories
Read-only access to public repositories.

☐ All repositories
This applies to all current and future repositories you own. Also includes public repositories (read-only).

☒ Only select repositories
Select at least one repository. Max 50 repositories. Also includes public repositories (read-only).

Select repositories 1

Select your PRIVATE Grill Master repository

Selected 1 repository.
